

# Testing

The Oxford English Dictionary tells us  
that the term “test” is derived from the Latin expression – testum

**Testing is any activity aimed at evaluating an attribute or capability of a program or system and determining that it meets its **required results****

**Testing is the process of executing a program or system with the intent of finding defects**

# What Is the Cost of Not Testing?

# Objectives of Test

# Fundamental Test Process

Test planning and control

Test Analysis and Design

Test Implementation and Execution

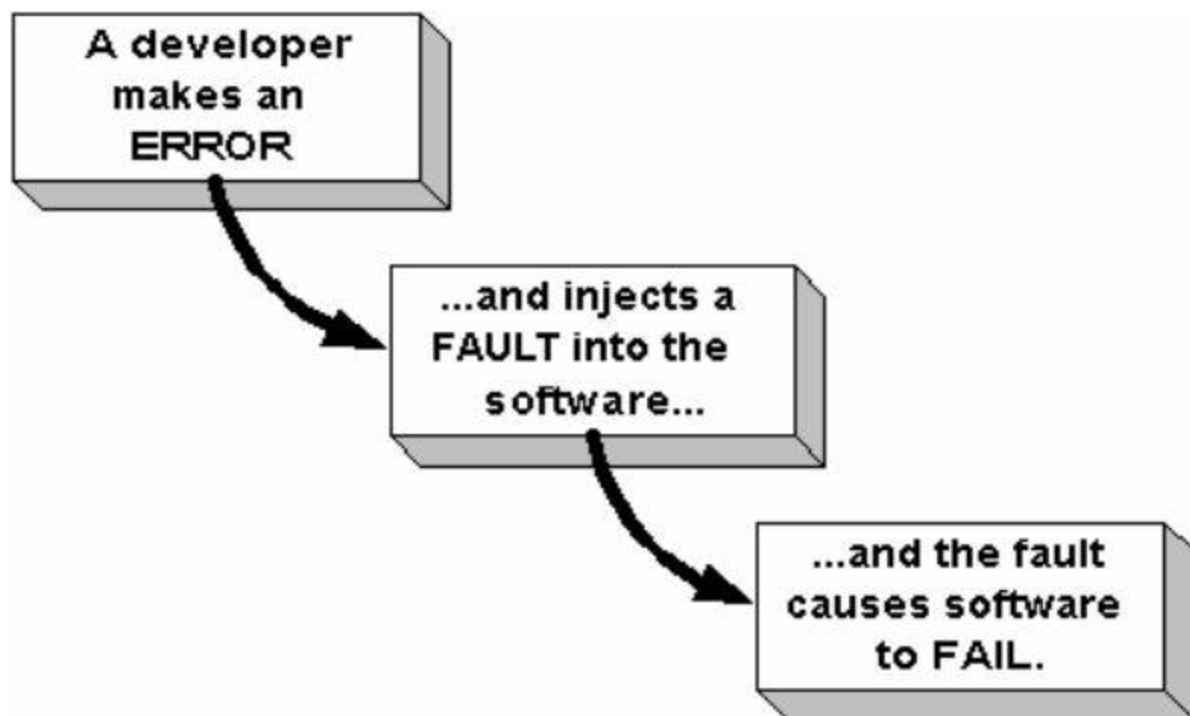

Evaluating exit criteria and reporting

Test Closure

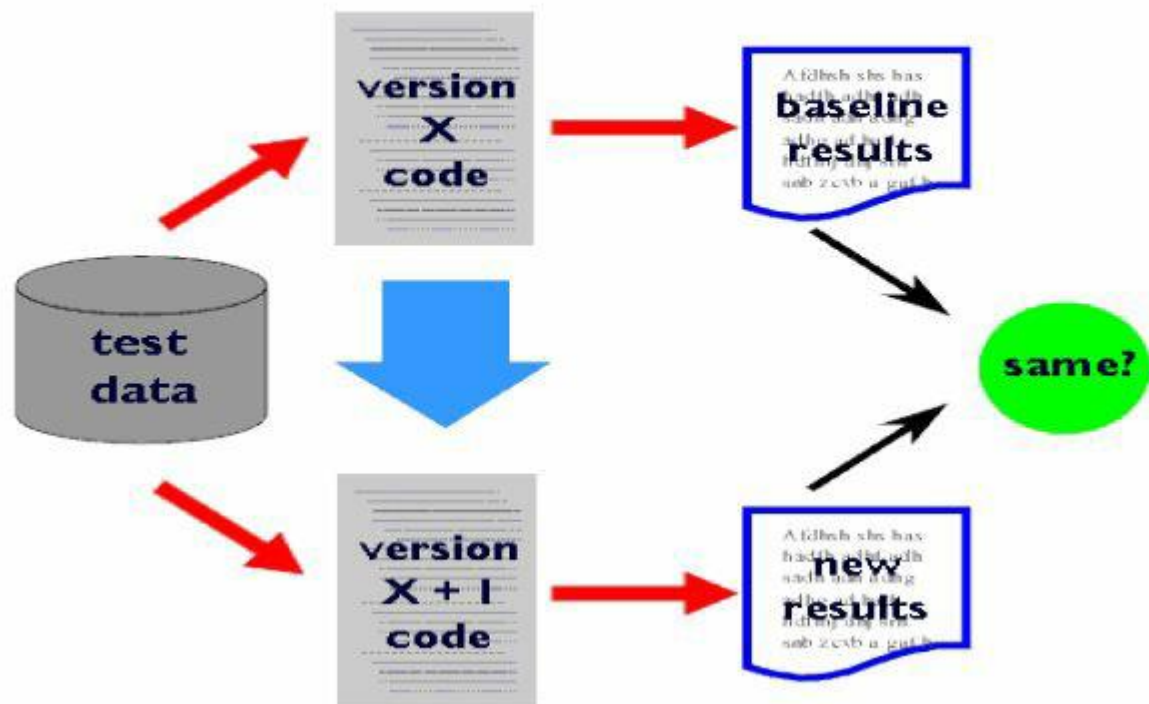

**We test  
because someone  
is concerned**

**If no one is concerned.....  
little or no testing gets done.**

# Expected Results

External specifications and **baselines** define what the software is required to do

Requirements Specification, Functional Specification, Design Specification etc.  
are baselines

# Prioritization

**Why Prioritization?**

# Prioritization

Make sure

The **most important tests** are included in test plans

The **most important tests are executed**

# Steps in Waterfall Model

## **1. Functional Specification**

# Steps in Waterfall Model

## **1. Technical Specification**

# Steps in Waterfall Model

## **1. Program Specification**

# Steps in Waterfall Model

## **1. Coding**

# Steps in Waterfall Model

1.

**2. Testing**

# Static Testing

There are two basic types:

1. People-based: generally known as “reviews”
2. Tool-based: for examining source code and are known as "static analysis"

## Types of review

- Informal
- Walkthrough
- Technical review
- Inspection

Low

Level of formality

High

# Static Analysis by Tools

1. Cyclomatic Complexity
2. Data flow analysis
3. Lines of code
4. Nesting levels
5. Number of function calls
6. Control flow analysis

## Steps of Test Design: Test Condition, Test Cases and Test Procedures

The three main steps of test design

1. **Test Condition** - is an item or event of a component or system that could be verified by one or more Test Cases e.g. a function, feature, attribute etc
2. **Test Case** - is a set of input values, execution preconditions, expected results and execution post conditions, developed for a particular objective or test condition, such as to exercise a particular program path or to verify compliance with a specific document
3. **Test Procedure Specification**
